

INDUSTRIE TESSILI BRESCIANE

Blankets for Transfer Printing Machines

These blankets have an inner scrim and a surface batt made of aramid Nomex® fibres to endure the high temperature of the transfer-printing machine cylinders. Such endless blankets, which have a good tracking, show a very smooth surface to avoid any possible marks on the fabrics to be processed and, thanks to a special heat-setting treatment, they run even under tension and do not shrink while in use. Their surface density varies according to how they are used, but normally it is of approximately 2300 g/m² and their thickness is of about 6-7 mm.
