## Endless Felt Blankets for Use with Compressive Shrinking Machine Palmers (Sanfor)

ITB blankets are manufactured with a precisely engineered woven scrim fabric to give maximum blanket strength and stability while providing ideal permeability. The scrim is made endless to ensure exact dimensions that last for the entire useful life of the blanket. While our choice of fibers is polyester, polyamid, acrylic, and/or blends of these fibers to enhance mechanical properties and resistance to hydrolysis and chemical agents, new fibers are continuously being evaluated.

The endless scrim is covered with layers of fiber batting precisely needed into the woven scrim fabric. The endless felt blanket is then heat-set and pre-stressed to ensure lifelong dimensional stability.

Special chemical treatments or finishes may be added to enhance the resistance of the blankets to the effects of resins and other process ingredients used in finishing textile fabrics which sometimes reduce drying capacity.

ITB felt blankets are available in specific weights from 1500 to 3000 g/m<sup>2</sup> with corresponding thicknesses of 4 to 10 mm.
